

Final Report

Title : VACATION PLANNER

Summary of project:

The **Vacation Planner** is an iOS mobile application developed using Swift, designed to assist users in seamlessly planning their ideal vacation. The app provides an intuitive and interactive experience, guiding users step-by-step from account creation to final trip preparation.

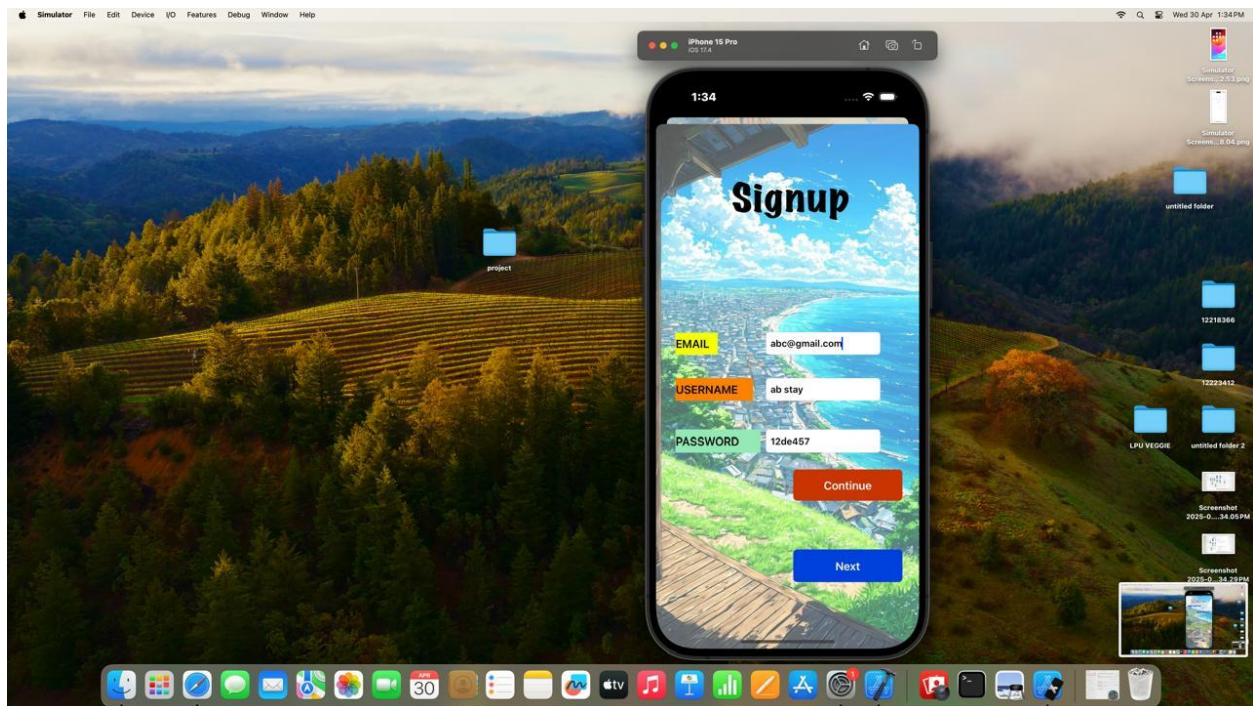

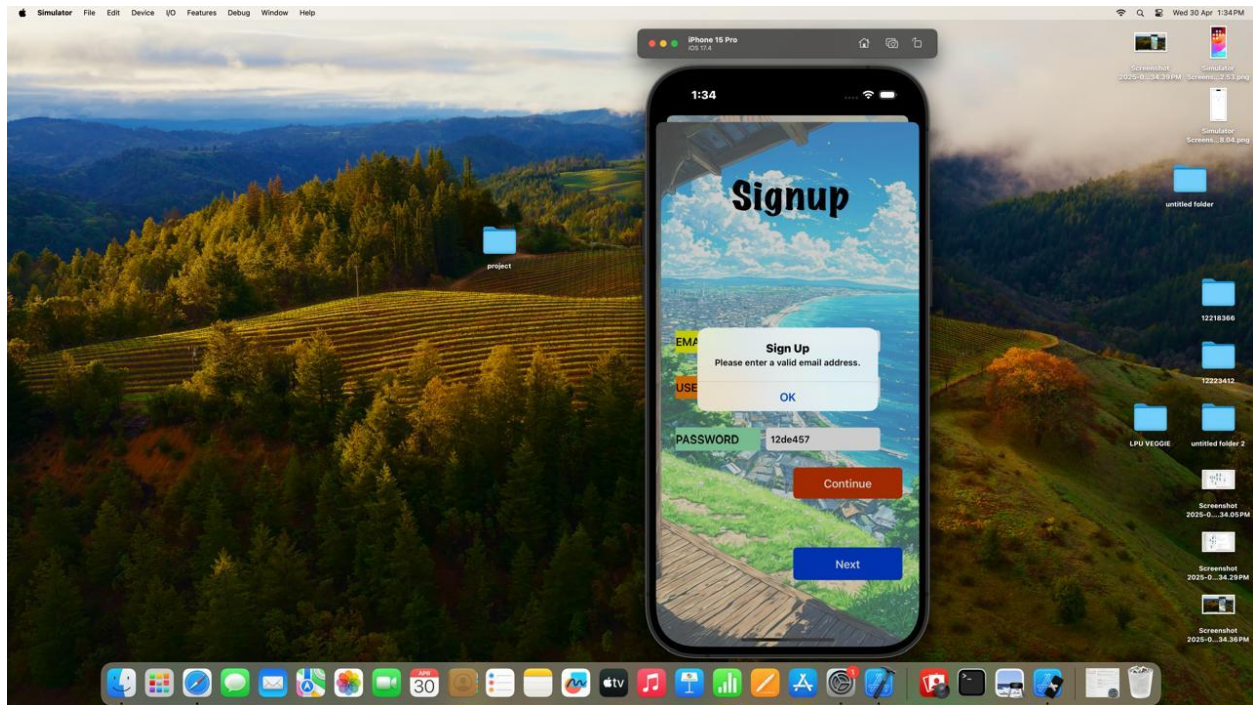

The app begins with a clean and simple **login/signup interface**, allowing users to create a new account or log in to an existing one. After successful authentication, users are prompted to choose the **type of vacation** they prefer — either a serene **mountain escape** or a relaxing **beach getaway**.

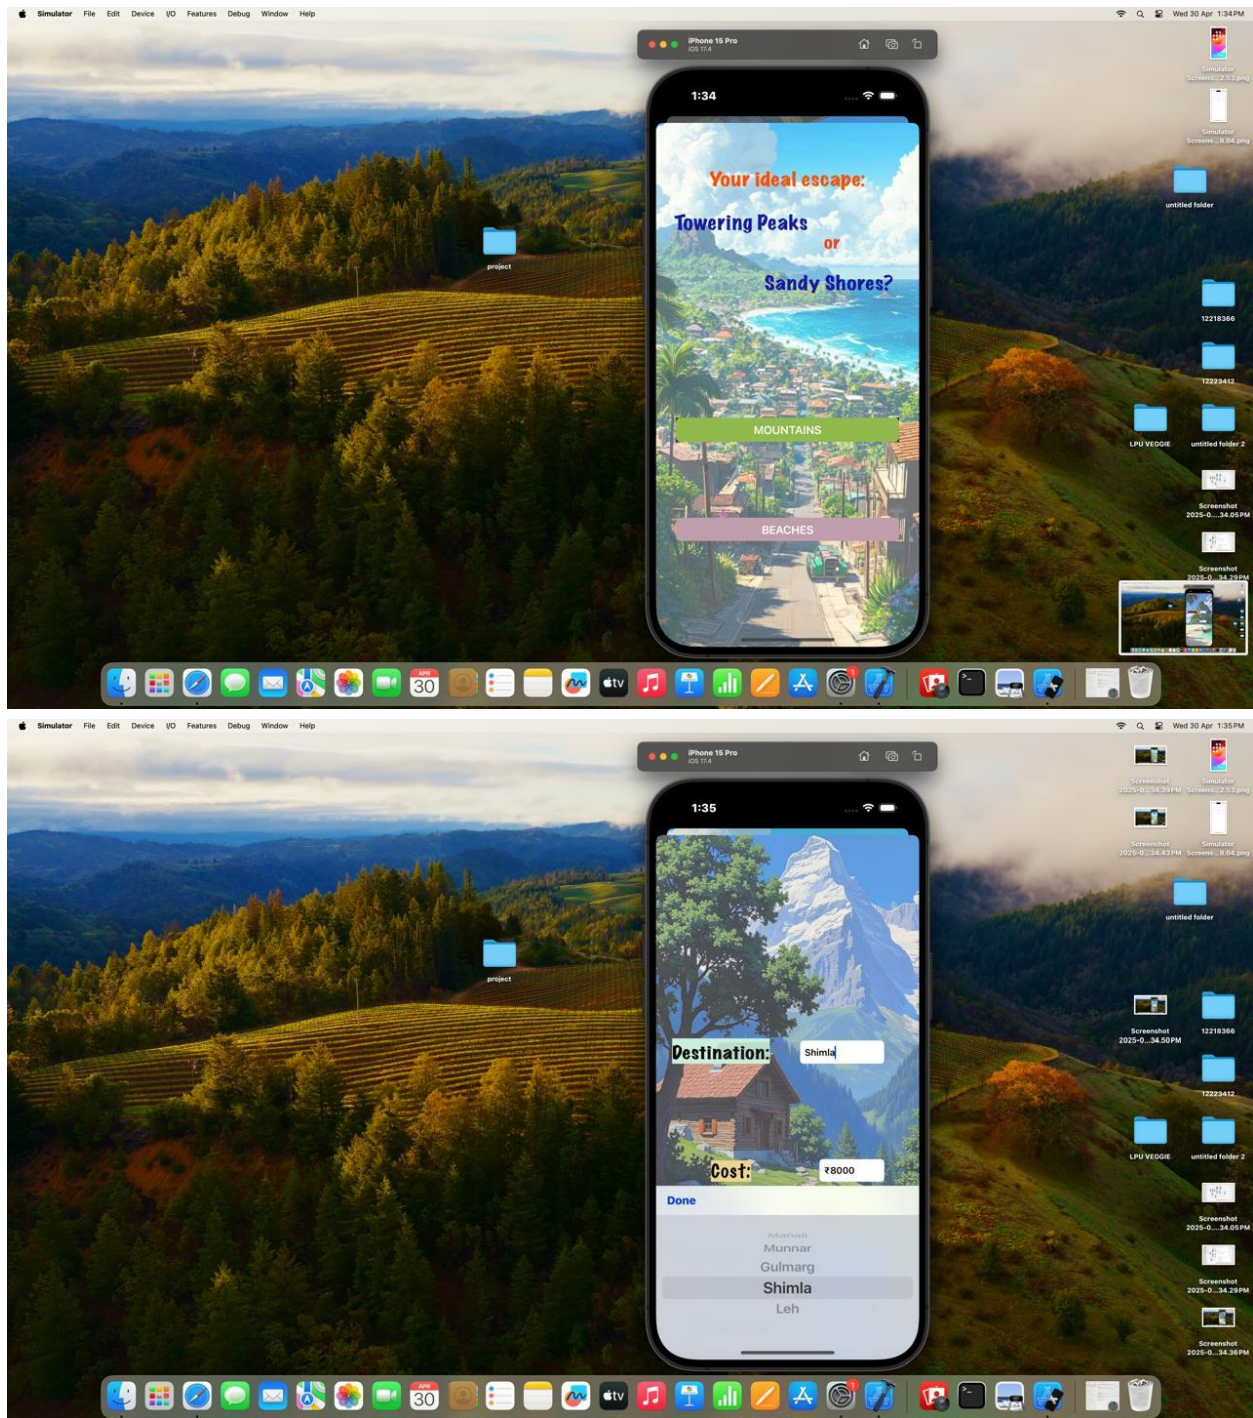

Based on their selection, users are shown a list of curated **destinations** with corresponding **travel costs**, helping them make informed decisions. The app then offers a checklist of **travel essentials**, ensuring that users are well-prepared for their journey.

To enhance user convenience, a dedicated section for **notes** allows travelers to jot down important reminders or personal plans. Additionally, the integrated **map feature** provides visual location details, improving navigation and trip planning.

The Vacation Planner app combines user-friendly design with practical features, offering a complete solution for anyone looking to organize their next holiday efficiently and enjoyably.

Snapshots of the App:

Rest of the app features can be seen in video

Code : I have uploaded the code on github
